SKILLS

Product & UX: UX Research, User Flows, CJM, Design Systems, A/B Testing, Multi-role UX, Accessibility (WCAG)

AI: Cursor, Claude (Code & Design), OpenCode, OpenDesign, Stitch, Figma Make, Figma Weavy, Google AI Studio

Tools: Figma, Miro, Notion, Asana, Adobe Creative Suite

Leadership: Team Management, Hiring & Onboarding, Mentorship

Frontend: HTML5, CSS3, JavaScript, Git, кроссбраузерная верстка, дизайн-ревью кода

LANGUAGES

English (B1 - Intermediate), Russian (Native)

Mar 2026 – Jun 2026

* Senior Product Designer / game «Bashnya» (Part-time)

Interface design, game UI development, AI-assisted art pipelines

Tasks: I conducted a competitive analysis of the gaming industry and designed a working concepts for the game interface, the product showcase grid, the shopping cart, and the queue system logic

Metrics: I created a UI kit that helped speed up feature development from 7 days to **3 days**. I streamlined the design processes, reducing T2D from 5 days to **2 days**

AI Implementation: I created a set of icons and a character (Nano Banana), which received high praise from the art director for their visual quality and how well they fit the style

Nov 2025 – Feb 2026

* Senior Product Designer / Forrest

ERP/CRM System for Restaurants

Product Features: Designed an administration system for three roles: owners, administrators and waitstaff. Implemented key functional modules: order management, delivery management, reservation management, and consolidated analytics. Developed an interactive dining room configurator with real-time visual table layout for reservations, as well as a Kanban board for managing the flow of orders

Metrics: After the updated scripts were launched, order processing time was reduced by **~28%**, reservation creation time by **~25%**, and the number of errors and conflicts when working with reservations decreased by **~37%**

Design-system: I seamlessly migrated the layouts from the first version to the product's v2, moving them from the old UI framework (MUI) to a new custom design system (Mantis)

Sen 2025 – May 2026

* Senior Web Designer, Full-stack Developer / Kant

A website with educational materials on the topic of anti-militarism

Product Features: I designed and developed the «Kant» web product from start to finish, including the UX/UI and functional front end, as well as a custom content management system

Metrics: I handled the entire process – from design to the user interface – on my own, combining the roles of product designer and front-end developer and eliminating the separate step of handing off mockups to the development team

AI Implementation: At Cursor, I set up an AI-assisted development process and independently implemented the product's front end and a custom CMS dashboard. I used AI to generate, refactor, and debug code

Oct 2021 – Feb 2024

* Senior Product Designer / JetRockets

An international IT company that develops digital products for foreign startups and mobile services

Product Features: I designed the MVP of the mobile app The Gut Stuff (B2C, Android/iOS) from scratch, incorporating complex features such as activity logs, nutrition and bowel movement trackers, custom reports, and gamification. I led a redesign following user testing. Working independently, I designed the desktop version of the MVP for the SayMore social platform (B2B2C), aimed at a mentally vulnerable audience, in three weeks. I conducted international benchmarking and designed monetization scenarios for the scaling phase

Metrics: The development of the MVP and subsequent redesign of The Gut Stuff app resulted in over **10K+ downloads** across app stores, helped establish daily user habits, and thereby increased LTV. Implementing a phased design approach ensured the product launched strictly within the set 6-month deadline, with **100% of the scope completed**

Design-system: Developed and maintained a scalable design system for the SayMore platform. The project comprised **over 1,000 screens** with responsive design

Management: As lead designer, I independently developed plans for design tasks, breaking down the scope and determining estimates, priorities and milestones for delivering mock-ups to ensure a seamless handover to the development team. I managed a junior designer, providing mentoring and creating technical specifications for illustrations and animations, as well as design QA

Oct 2020 – Jul 2021

✱ **Product Designer / Oproso**

A SaaS platform for conducting UX research and gathering customer experience data

Product Features: I designed B2B interfaces, including user dashboards, control panels, and admin panels, for three role models. After analyzing user patterns and business requirements, I created interactive prototypes in Figma. I collaborated with a product triad (product manager, analyst, and developer) using the Scrum methodology

Metrics: I redesigned the analytical tables and configurators. This reduced the time clients spent processing reports by **18%** and cut the number of errors when setting up complex survey scenarios by **12%**. I also designed an updated administration panel that reduced technical support requests by **15%**

Researches: I conducted an in-depth analysis of all existing types of graphs and charts. I compared them based on how easily data from surveys could be read. Then, I created several intuitive dashboards for working with large volumes of information

Oct 2014 – Jan 2020

✱ **Frontend Developer**

Commercial interface development, managing small teams on special projects

Cross-browser and responsive layout, UI component development (HTML, CSS, JavaScript, Git), layout review

For a major special project for 1tv.ru, I served as project manager. My responsibilities included communicating with the client (the editorial team), gathering requirements, decomposition tasks and distributing the workload among the development team
